Green Turtle Launches Retroceptor: Next Generation Grease Interception Performance

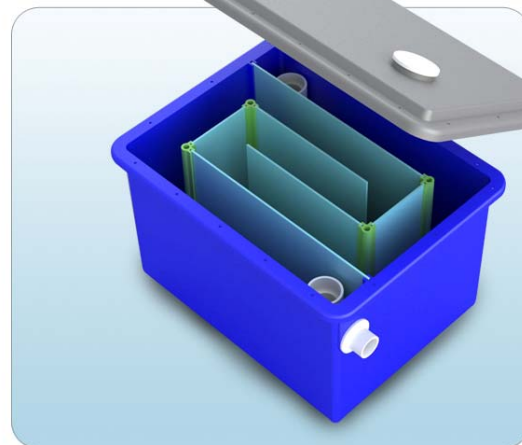

July 29, 2008. Building on its track record for innovative grease interception technologies, Green Turtle announced today the launch of its new under-the-sink grease interceptor – the Retroceptor.

The Retroceptor is a game-changer in the food service industry. It dramatically increases grease removal performance, yielding a 99.6% reduction in the amount of fats, oil and grease (FOG) released into the wastewater stream. This compares to PDI-certified grease traps that remove only 90%.

“Conventional grease traps are based on designs from the 1880s,” said Rob Abernethy, Manager of International Markets. “Our engineering team started fresh, to create a solution that responds to the demands of today’s overburdened infrastructure.”

The current performance certification for grease traps is 1,200 ppm of free oil. The Retroceptor has been proven to perform at 60 ppm of free oil. A municipality with 500 restaurants releasing 59,400 gallons of FOG per year into the sanitary sewer system could reduce this pollution by 56,400 gallons -- 95% -- by using Retroceptor technology.

In addition, the Retroceptor is constructed from a corrosion-resistant and leak-proof composite to handle high temperatures, with an airtight seal. It is backed by a 10-year warranty. At 1/3 the weight of steel units, installation is quick and simple.
